

Finishing the app

Six steps to launch. No coding required — every one is signing up for something, copying a value, and pasting it into a web page.

Where things stand today

The app is **built, tested and secure**. It runs right now on a computer, with real data. The database has been independently audited — zero security errors, zero performance errors — and it has been tested on both iPhone and Android.

What is left is connecting it to outside services: **payments, email, and Apple**. Those need your name, your card and your accounts. Nobody else can create them for you — that is the only reason they are not done.

The whole picture

	Step	Cost	Time
1	Connect GitHub to the database	Free	2 min
2	Set your own password	Free	5 min
3	Connect Stripe (payments)	Free to set up	45 min
4	Connect email	Free	30 min
5	Join Apple Developer	\$99 / year	30 min + wait
6	Test on a real phone	Free	45 min

Start step 5 first. Apple takes 24–48 hours to approve you, and nothing about the iPhone app can happen until they do. Pay the \$99, then work through steps 1–4 while you wait.

1

Connect GitHub to the database

Free

2 minutes

This makes future updates automatic. When a change is approved, the database updates itself instead of someone typing commands by hand.

Only you can do this step. The code lives under your personal GitHub account, and GitHub only lets the account holder authorize new tools. Adam has already done all the preparation on the database side.

1. Go to your Supabase project, then **Settings** → **Integrations**.
2. Under **GitHub**, click **Connect GitHub** and sign in.
3. When GitHub asks where to install, choose **relaxedlivingvalet** and give it access to the **valettrashmobile** repository.
4. Back in Supabase, select that repository and set the branch to **main**.

Done when: the Integrations page shows the repository name where the “Connect” button used to be.

2

Set your own password

Free

5 minutes

Your account currently uses a temporary password that was created for testing and written down in the project files. Replace it with one only you know.

1. Open the app and sign in with **Staff**, using the temporary password Adam gives you.
2. Go to **More** → **Change Password** and set a new one.
3. Tell Adam once it is changed, so he can clear the old one out of the files.

Done when: you can sign out and back in with your new password.

3

Connect Stripe so residents can pay

Free to set up

45 minutes

Stripe handles card payments for extra pickups (\$5 / \$14 / \$20 packs). It takes about 2.9% + 30¢ per payment, with no monthly fee.

3a — Get your two keys

1. Sign in at **dashboard.stripe.com**.
2. Top right, make sure **Test mode** is **ON** while we are testing.
3. **Developers** → **API keys** → reveal the **Secret key** and copy it. It starts with `sk_test_`

3b — Tell Stripe where to send confirmations

1. **Developers** → **Webhooks** → **Add endpoint**.
2. Paste this exactly as the endpoint URL:

```
https://immiejqvnucndjpacwv.supabase.co/functions/v1/stripe-webhook
```
3. Click **Select events**, tick **checkout.session.completed**, then **Add endpoint**.
4. Reveal the **Signing secret** and copy it. It starts with `whsec_`

3c — Give both keys to the app

In Supabase, go to **Settings** → **Edge Functions** and add three secrets. Type the names exactly:

Name	Value
STRIPE_SECRET_KEY	the sk_test_... key from 3a
STRIPE_WEBHOOK_SECRET	the whsec_... key from 3b
APP_ORIGIN	http://localhost:8091

Done when: all three names appear in the list. You will not be able to see the values again — that is normal and correct.

Going live later: when you are ready to take real money, switch **Test mode** off, repeat 3a and 3b to get the live keys, and replace those two secrets. Only do this after a test purchase has worked.

4 Make password-reset emails work

Free to start

30 minutes

Right now the app can only send **2–3 emails per hour** — that is the built-in limit for testing. With real residents, most “I forgot my password” emails would never arrive.

Recommended: Resend — free for 3,000 emails a month, plenty to start.

1. Sign up at **resend.com**.
2. **Domains** → **Add Domain** → enter **relaxlivingvalet.com**.
3. Resend shows a few DNS records. These go wherever you bought the domain (GoDaddy, Namecheap, etc.), under “DNS settings”.
4. Once the domain shows **Verified: API Keys** → **Create API Key**, and copy it.
5. In Supabase: **Settings** → **Authentication** → **SMTP Settings**. Turn on **Enable Custom SMTP** and fill in:

Host	smtp.resend.com
Port	465
Username	resend
Password	the API key from step 4
Sender email	noreply@relaxlivingvalet.com
Sender name	Relaxed Living Valet

Done when: you tap “Forgot password?” in the app and the email lands in your inbox within a minute.

The DNS step is the fiddly one. If you are unsure, send Adam a screenshot of the records Resend shows you, plus where you bought the domain. He can walk you through it in a few minutes.

5 Join the Apple Developer Program

\$99 / year

30 min + 1-2 day wait

You need this to put the app on **any** iPhone or iPad — including your own, and including the in-person demo. There is no way around it and no free alternative.

1. Go to **developer.apple.com/programs/enroll**
2. Sign in with your Apple ID, or create one.
3. Choose **Organization** if the business is an LLC (you will need your EIN), or **Individual** if it is just you — faster, less paperwork.
4. Pay the **\$99**, then wait. Apple usually approves within 24–48 hours; an Organization can take a week.

Done when: Apple emails you that your membership is active. Tell Adam — he will build the app and send it to your phone through TestFlight.

Android is separate and costs **\$25 once, forever**, at play.google.com/console/signup. Worth doing, but not urgent.

6

Test on a real phone

Free

45 minutes

Once Adam sends the TestFlight invite, install it and work through this list. These are the things a computer genuinely cannot check for you.

- ☐ Sign in as each of the six roles — Adam has the logins.
- ☐ On **Owner** → **Financials**, tap **Export CSV**. The share sheet should open. **Try this on an iPad specifically** if you plan to demo on one — it used to fail there.
- ☐ As a worker: **Clock In**, then **Share location**. Allow the permission prompt.
- ☐ As a worker: report a violation with a photo, and confirm it saves.
- ☐ As a resident: **Forgot password?** → check the email arrives → reset it → confirm the link opens the app.
- ☐ Buy a \$5 pickup pack with Stripe's test card 4242 4242 4242 4242, any future expiry, any 3-digit code. Confirm the credit appears.

Anything that misbehaves — screenshot it and send it to Adam.

One rule worth remembering

Never paste a key starting with `sk_` into an email, a text, or a shared document. Those keys can move real money. They belong in exactly one place: the Supabase secrets page in step 3c.

Everything else in this guide is safe to get wrong and simply try again.

Quick reference

The code	github.com/relaxedlivingvalet/valettrashmobile
Database & settings	supabase.com/dashboard
Payments	dashboard.stripe.com
Email	resend.com
Apple	developer.apple.com

Adam can run a single health check at any point that reports which of these steps are done and which are still outstanding — so neither of you has to guess.
